# Uso de plantillas pipelines YAML en Azure DevOps

Ricardo Barreno

#### Ricardo Barreno

**Azure Solutions Architect** 

Speaker

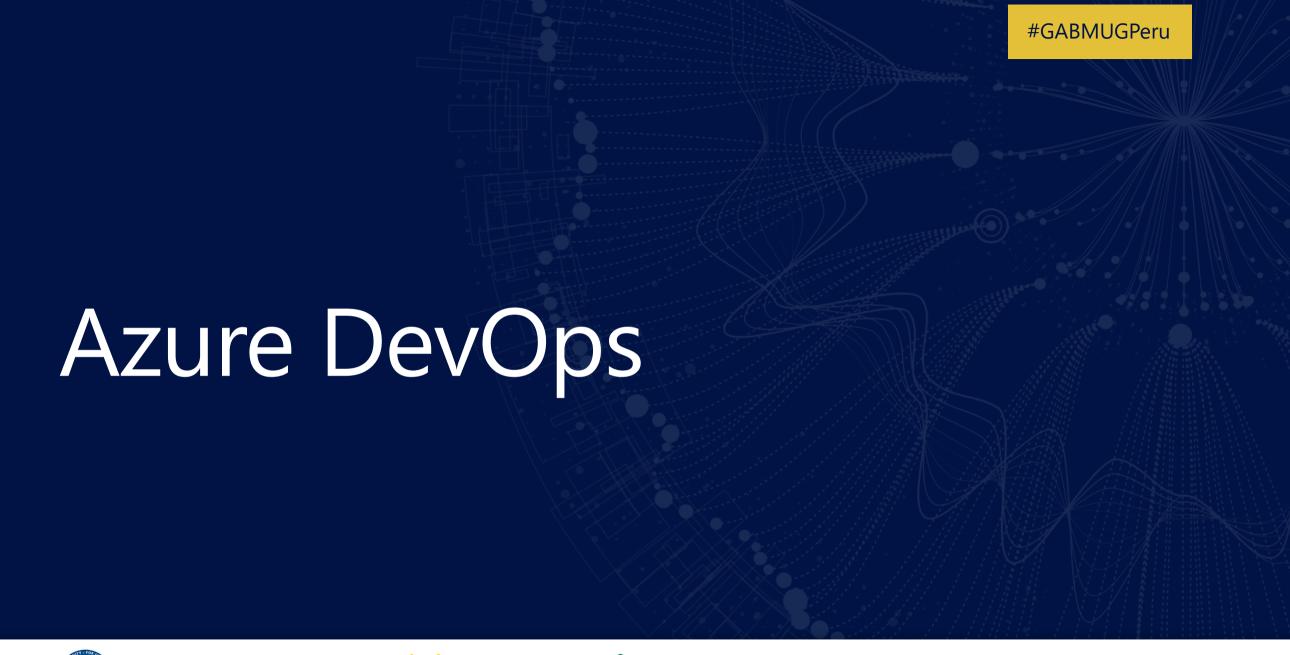

#### Agenda

- Azure DevOps
- Azure Pipelines
- Ejemplo

#### Azure DevOps

- Plataforma integral de desarrollo colaborativo de software de Microsoft.
- Automatización de procesos de entrega continua.
- Gestión completa del ciclo de vida del desarrollo de Software.
- Colaboración mejorada entre equipos de desarrollo y operaciones.
- Seguimiento y gestión eficaz de tareas y problemas.

#### Azure DevOps - Servicios

#### Azure Boards

Plan, track, and discuss work across teams, deliver value to yout users faster.

#### Azure Repos

Unlimited cloudhosted private Git repos. Collaborative pull requests, advanced file management, and more.

Azure Pipelines

CI/CD that Works with any language, platform, and cloud. Connect to GitHub or any Git provider and deploy continuosly to any cloud.

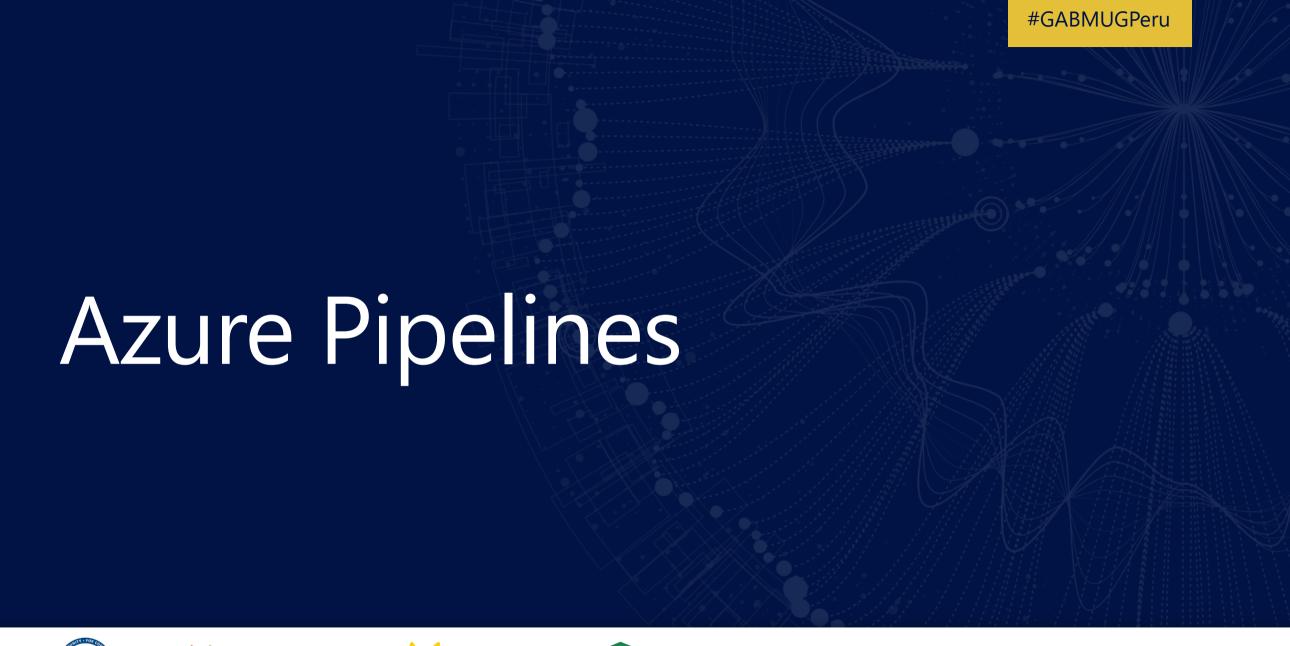

Azure Test Plans

The test management and explortory testing toolkit that lets you ship with confidence.

Azure Artifacts

Create, host, and share packages.
Easily add artifacts to CI/CS pipelines.

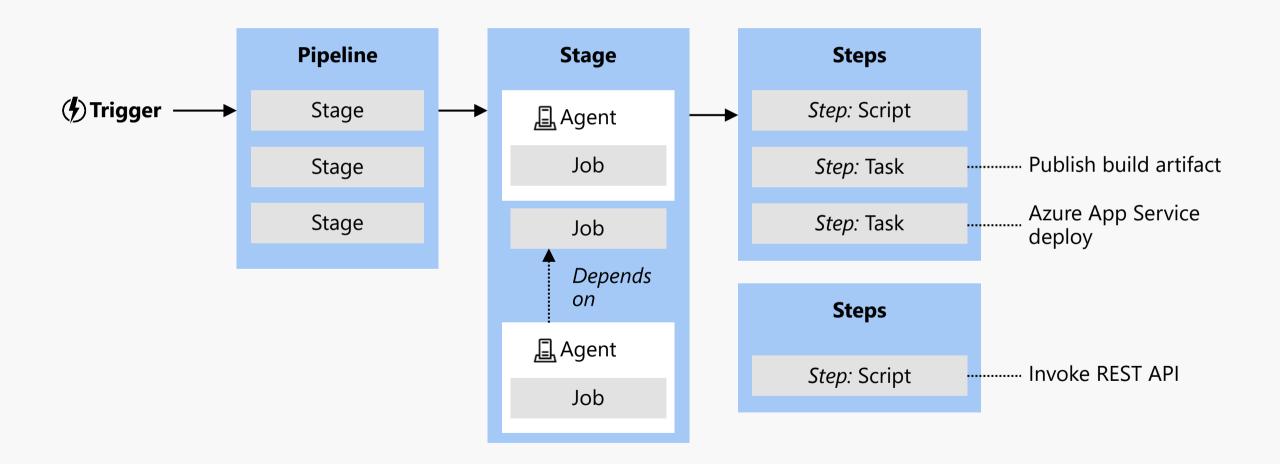

#### Azure Pipelines

- Servicio de CI/CD en la nube que permite compilar, probar y desplegar aplicaciones.
- Compatibilidad con cualquier lenguaje, plataforma o nube.
- Escalabilidad para adaptarse a proyectos pequeños y grandes.
- Flexibilidad para definir flujos de trabajo personalizados.

#### Azure Pipelines – Key Concepts

#### Azure Pipelines - YAML

- Lenguaje de marcado utilizado para definir pipelines en Azure DevOps.
- Simplificación de la configuración y mantenimiento de pipelines.
- Legibilidad mejorada y sintaxis clara para definir pipelines.
- Facilidad de control de versiones al ser archivos de texto plano.
- Flexibilidad para adaptar flujos de trabajo a diferentes necesidades.

#### Azure Pipelines – Plantillas YAML

- Fragmentos reutilizables de código YAML que permiten definir configuraciones de pipelines.
- Simplificación y estandarización de la configuración del pipeline.
- Reutilización de patrones comunes de configuración en múltiples pipelines.
- Facilita el mantenimiento al centralizar la lógica de configuración en un solo lugar.

## Ejemplo

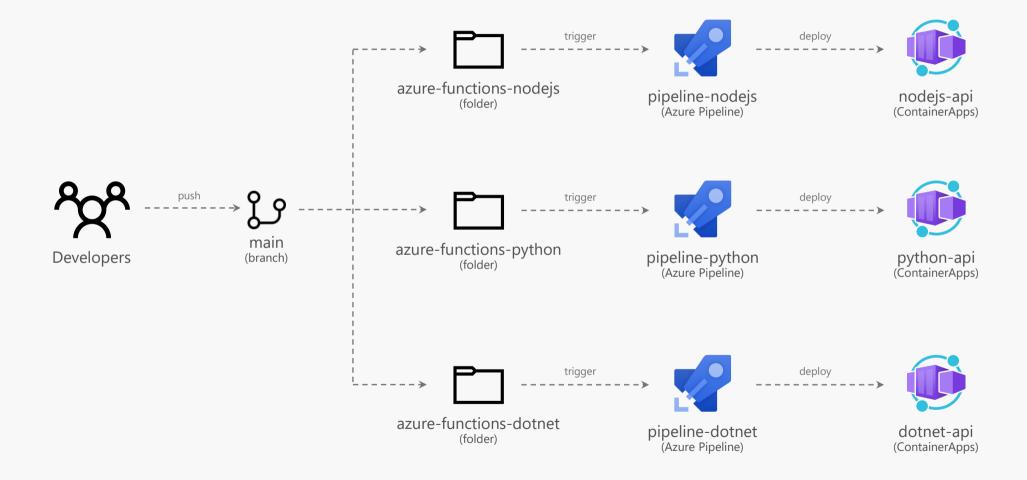

#### Ejemplo – Diagrama

```
name: dotnet-pipeline
trigger:
 branches:
   include:
      - main
      develop
  paths:
   include:
     - src/azure-function-dotnet
:loog
 vmImage: 'ubuntu-latest'
extends:
 template: templates/base-pipeline.yml
 parameters:
   language: dotnet
   workingDirectory: src/azure-function-dotnet
    repositoryName: azure-function-dotnet
```

dotnet-pipeline.yml

```
- name: language
   type: string
   values:
    - dotnet
     - python
     - nodeis
 - name: workingDirectory
   type: string
 - name: repositoryName
   type: string
variables:
 - template: vars.yml
   parameters:
     language: ${{ parameters.language }}
  - ${{    if eg(parameters.language, 'dotnet')    }}:
   - template: dotnet-build-stage.yml
       workingDirectory: ${{ parameters.workingDirectory }}

    template: contenerization-stage.yml

   parameters:
    containerRegistry: '${{ variables.containerRegistry }}'
    repository: '${{ variables.dockerHubUsername }}/${{ parameters.repositoryName }}'
     buildContext: ${{ parameters.workingDirectory }}
   template: deployment-stage.yml
     azureSubscription: '${{ variables.azureSubscription }}'
     containerAppName: '${{ variables.containerAppName }}'
    resourceGroup: '${{ variables.resourceGroupName }}'
     imageToDeploy: '${{ variables.containerRegistryServer }}/${{ parameters.repositoryName }}:$(Build.BuildId)
```

templates/base-pipeline.yml

```
parameters:
  - name: language
    type: string
    values:
      dotnet
      - python
     - nodeis
variables:
  - name: dockerHubUsername
